## I Created a Drink Water Notification Reminder App in Python

In this tutorial we are going to create a python application which will remind us to drink water periodically.

This application will track time and show you notification after a brief period of time to remind you to drink water. We are going to use ***plyer*** module to show the notification and the ***time*** module to run the module after a fixed period of time. You can install plyer by typing “**pip install plyer**” on the terminal/cmd. For better understanding watch the complete video.

```
import time
from plyer import notification
if __name__ == '__main__':
    while True:
        notification.notify(
            title = "**Please Drink Water Now!!",
            message = "The National Academies of Sciences, Engineering, and Medicine determined that an adequate daily",
            app_icon = "path to your .ico file",
            timeout= 12
        )
        # time.sleep(6)
```

[Copy](#)

```
time.sleep(60*60)
```
